9.12.8. Tariff Examples

9.12.8.1. Flat Rate

A flat rate tariff has the simplest structure: the consumer pays a single price at all times of year.

For example if a tariff charges:

1. $0.1485 per unit, all day, every day, starting on 2025/01/01

This can be represented by:

1. One DayEntryStruct starting at midnight; in this example, the DayEntryID is 0x19
2. One DayPatternStruct with all DaysOfWeek set and containing the DayEntryID 0x19; in this example, the DayPatternID is 0x15
3. One CalendarPeriodStruct starting on 2025/01/01 and containing the DayPatternID 0x15
4. One TariffComponentStruct with a standard price of $0.1485; in this example, the TariffComponentID is 0x29
5. One TariffPeriodStruct linking the TariffComponentID of 0x29 to the DayEntryID of 0x19

TariffPeriods

Label	TariffComponentIDs	DayEntryIDs
All Day	[0x29]	[0x019]

TariffComponents

TariffComponentID	Price		Threshold
0x29	*PriceType*	Standard	0
	Price	$0.1485	

DayEntries

DayEntryID	StartTime
0x19	0

DayPatterns

DayPatternID	DaysOfWeek	DayEntryIDs
0x15	0x7F	[0x19]

CalendarPeriods

StartDate	DayPatternIDs
2025/01/01	[0x15]

Figure 22. Example of a flat rate commodity tariff

9.12.8.2. Flat Rate with Blocks

Tariffs may have thresholds of consumption; when an account has consumed more than the threshold, a new rate applies.

For example, if a tariff charges:

1. $0.40 per unit, all day, every day, starting on 2025/01/01
2. $0.50 per unit, once 100 units have been consumed

This can be represented by:

1. One DayEntryStruct starting at midnight; in this example, the DayEntryID is 0x806
2. One DayPatternStruct with all DaysOfWeek set and containing the DayEntryID 0x806; in this example, the DayPatternID is 0x62
