

(when provided) to guide the user to the manufacturer-provided means towards resolution of the commissioning issues.

5.7.5.3. URL used in Commissioning Fallback Mechanism

The [Section 11.23.6.14, “CommissioningFallbackUrl”](#) MAY be constructed in the same way as the [Section 11.23.6.9, “CommissioningCustomFlowUrl”](#) field, including making it specific for a particular VendorID and/or ProductID (as described in [Section 5.7.3, “Custom Commissioning Flow”](#), 5th bullet). Also, the query components as described in [Section 5.7.3.1, “CommissioningCustomFlowUrl format”](#) can be added to the URL to improve the overall flow. For example, usage of **MTop**, **MTcu** and **MTrop** parameters would be useful to smooth the flow in case the manufacturer-provided mechanism uses a manufacturer-defined mechanism to get the device on the IP network, after which the original commissioner can take care of the Matter commissioning (“[device already on IP-network](#)”).

An example of this flow is illustrated below. The “DCL info” concept denotes that the Commissioner SHALL collect the information from the DCL via some mechanism, such as a network resource accessible to the Commissioner containing a replicated set of the DCL’s content.

Figure 50. Commissioning Fallback Mechanism sequence diagram

In the flow above:

- In the final steps, the User might have to perform the trigger to the Commissioner, so that it can start or continue the commissioning process.
- If possible, a Commissioner MAY continue to scan for announcements from the device in the background while any manufacturer-specific app is configuring the device to be available for commissioning. The Commissioner might need a new OnboardingPayload provided to the User by the Manufacturer Website or App.
- In order to simplify the flow, the Commissioner MAY:
 - Include the onboarding payload obtained from the user (see [Section 5.7.3.1, “CommissioningCustomFlowUrl format”](#) for **MTop** key details) within the **CommissioningFallbackUrl**.
