

access requested;

- Determining the [set of granted privileges](#) for the action, given the request path and requesting subject;
- Checking whether the required privilege is present in the set of granted privileges:
 - If present, the action is allowed;
 - If not present, the action is denied.

Note that the Interaction Model may allow the action for some request paths while denying it for other request paths in the same action. Also, note that Access Control is merely one of the checks used by the Interaction Model, and an action that is allowed by Access Control may fail for other reasons.
