

Value	Name
255	Unknown

If the window covering supports both the LF and TL features, the following types are allowed to be used:

Value	Name
8	TiltBlindLiftAndTilt
255	Unknown

5.3.6.2. NumberOfActuationsLift Attribute

This attribute SHALL indicate the total number of lift/slide actuations applied to the window covering since the device was installed.

5.3.6.3. NumberOfActuationsTilt Attribute

This attribute SHALL indicate the total number of tilt actuations applied to the window covering since the device was installed.

5.3.6.4. ConfigStatus Attribute

This attribute specifies the configuration and status information of the window covering.

To change settings, devices SHALL write to the Mode attribute. The behavior causing the setting or clearing of each bit is vendor specific.

5.3.6.4.1. Operational Bit

The [SafetyStatus](#) & [Mode](#) attributes might affect this bit state.

5.3.6.4.2. LiftMovementReversed Bit

This bit identifies if the directions of the lift/slide movements have been reversed in order for commands (e.g: Open, Close, GoTos) to match the physical installation conditions

This bit can be adjusted by setting the [MotorDirectionReversed](#) bit in the [Mode](#) attribute.

5.3.6.4.3. LiftEncoderControlled Bit

This bit is ignored if the device does not support the PositionAwareLift feature (PA_LF).

5.3.6.4.4. TiltEncoderControlled Bit

This bit is ignored if the device does not support the PositionAwareTilt feature (PA_TL).

5.3.6.5. CurrentPositionLiftPercent100ths Attribute

This attribute SHALL indicate the actual position as a percentage with a minimal step of 0.01%. E.g Max 10000 equals 100.00%.
