

If the EVSE does not support the SOC feature or cannot obtain the SoC of the vehicle:

- the AddedEnergy field SHALL take precedence over the TargetSoC field, and if the EVSE does not support the SOC feature then the TargetSoC field may only take the values null or 100%.
- if the AddedEnergy field has not been provided, the EVSE SHOULD assume the vehicle is empty and charge until the vehicle stops demanding a charge.

#### 9.3.7.6.3. AddedEnergy Field

This field represents the amount of energy that the user would like to have added to the vehicle before the TargetTimeMinutesPastMidnight.

This represents a positive value in mWh that SHOULD be added during the session (i.e. if the vehicle charging is stopped and started several times, this equates to the total energy since the vehicle has been plugged in).

The maximum value (500kWh) is much larger than most EV batteries on the market today. If the client tries to set this value too high then the EVSE will need to start charging immediately and continue charging until the vehicle stops demanding charge (i.e. it is full). Therefore the maximum value should be set based on typical battery size of the vehicles on the market (e.g. 70000Wh), however this is up to the client to carefully choose a value.

#### NOTE

If the EVSE can obtain the Battery Capacity of the vehicle, it SHOULD NOT limit this AddedEnergy value to the Battery Capacity of the vehicle, since the EV may also require energy for heating and cooling of the battery during charging, or for heating or cooling the cabin.

#### 9.3.7.7. ChargingTargetScheduleStruct Type

This represents a set of user specified charging targets for an EV for a set of specified days.

| ID | Name                   | Type                                         | Constraint | Quality | Fallback | Access | Conformance |
|----|------------------------|----------------------------------------------|------------|---------|----------|--------|-------------|
| 0  | Day-OfWeek-ForSequence | <a href="#">TargetDay-OfWeek-Bitmap</a>      | all        |         |          |        | M           |
| 1  | Charging-Targets       | list[ <a href="#">ChargingTargetStruct</a> ] | max 10     |         |          |        | M           |

#### 9.3.7.8. DayOfWeekForSequence Field

This field SHALL indicate the days of the week that the charging targets SHOULD be associated to. This field is a bitmap and therefore the associated targets could be applied to multiple days.
