

Chapter 6. Switches and Controls Device Types

This Chapter specifies a number of "controller" device types like On/Off Light Switch and Dimmer Switch. Some products implementing these device types are intended to replace legacy switches or dimmers that directly control the power to a load. For such products, manufacturers are encouraged to implement an additional endpoint on the same product holding an "actuator" device type like an On/Off Light (or On/Off Plug-in Unit) or Dimmable Light (or Dimmable Plug-in Unit), consistent with the type of control it can provide to the load. In case product can control multiple loads separately, multiple such endpoints to each hold a device type for each load.

Additionally, having a central control function allows much richer automation triggered by a press of a switch. In such case, a switch works more like a sensor. For this, the Generic Switch device type is defined. See [Section 6.6, "Generic Switch"](#). Manufacturers are encouraged to implement the Generic Switch device type as well in products that are generically referred to as switches. See [Section 6.6.5, "Relation with other Switch device types \(informative\)"](#) for examples how these device types can be combined.

6.1. On/Off Light Switch Device type

An On/Off Light Switch is a controller device that, when bound to a lighting device such as an On/Off Light, is capable of being used to switch the device on or off.

6.1.1. Revision History

Revision	Description
1	Initial Zigbee 3.0 revision
2	New data model format and notation
3	Updated the Scenes cluster to Scenes Management with Cluster ID: 0x0062

6.1.2. Classification

Device Type ID	Device Type Name	Superset Of	Class	Scope
0x0103	On/Off Light Switch		Simple	Endpoint

6.1.3. Conditions

See the Base Device Type definition for conformance tags.
