

```
-- Matter Device Attestation Certificate DN attribute for the Vendor ID (VID)
matter-oid-vid OBJECT IDENTIFIER ::= { matter-att-root 1 }

-- Matter Device Attestation Certificate DN attribute for the Product ID (PID)
matter-oid-pid OBJECT IDENTIFIER ::= { matter-att-root 2 }
```

6.2.2.1. Device Attestation Public Key Infrastructure (PKI)

The Device Attestation PKI hierarchy consists of the PAA, PAI and individual DAC. The public key from the associated [PAI certificate](#) is used to cryptographically verify the DAC signature. The PAI certificate in turn is signed and attested to by the Product Attestation Authority (PAA) CA. The public key from the associated PAA certificate is used to cryptographically verify the PAI certificate signature. The PAA certificate is an implicitly trusted self-signed root certificate. In this way, the DAC chains up to the PAI certificate, which in turn chains up to the PAA root certificate. A PAI SHALL be assigned to a [Vendor ID](#) value. A PAI MAY further be scoped to a single [ProductID](#) value. If a PAI is used for multiple products, then it cannot be scoped to a ProductID value, otherwise the [Device Attestation Procedure](#) will fail policy validations.

Commissioners SHALL use PAA and PAI certificates to verify the authenticity of a Commissionee before proceeding with the rest of the Commissioning flow.

The [subject](#) of all DAC and PAI certificates SHALL be unique among all those issued by their issuer, as intended by [RFC 5280](#) section 4.1.2.6, through the use of [RelativeDistinguishedName](#)s that ensure the uniqueness, such as for example a unique combination of [commonName](#) (OID 2.5.4.3), [serialNumber](#) (OID 2.5.4.5), [organizationalUnitName](#) (OID 2.5.4.11), etc. The exact additional constraints, including for the subject field, for PAA, PAI and DAC certificates, are presented in the following subsections.

The following figure shows the Device Attestation PKI hierarchy.
