

Chapter 7. Data Model Specification

7.1. Practical Information

7.1.1. Revision History

Please note that Matter revision 1 SHALL be considered equivalent to revision 16, Subsequent releases SHALL start at revision 17.

Revision	Description
1	Equivalent to revision 16 (1st Matter release of the Data Model)
2-11	Approved specifications, but not released for implementation.
12-15	Released as revisions of the Dotdot Architecture Model specification
16	Initial release of this specification
17	Added tag data type
18	Added the LocationDescriptorStruct data type
19	Changed F quality description

7.1.2. Scope & Purpose

This is part of a package of Data Model specifications that are agnostic to underlying layers (encoding, message, network, transport, etc.). Each specification below may be independently maintained. This package, as a whole, SHALL be independently maintained as agnostic and decoupled from lower layers. This package may be referenced by inclusion in vertical protocol stack specifications.

Data Model	Defines first order elements and namespace for endpoints, clusters, attributes, data types, etc.
Interaction Model	Defines interactions, transactions and actions between nodes.
System Model	Defines relationships that are managed between endpoints and clusters.
Cluster Library	Reference library of cluster specifications.
Device Library	Reference library of device type specifications.

7.1.3. Origin Story

The origin of this section is the Dotdot Architecture Model [[Dotdot Architecture](#)] and parts of Chapter 2 of the Zigbee Cluster Library specification [[ZCL](#)] that define the data model.

This document defines the specific model used in Matter, which has diverged from Zigbee.
