

Bit	Code	Feature	Conformance	Summary
14	ALBU	AliroBLEUWB	[ALIRO]	Lock supports the Bluetooth LE + UWB Access Control Flow as defined in Aliro

5.2.4.1. PINCredential Feature

If the User Feature is also supported then any PIN Code stored in the lock SHALL be associated with a User.

A lock MAY support multiple credential types so if the User feature is supported the UserType, User-Status and Schedules are all associated with a User index and not directly with a PIN index. A User index may have several credentials associated with it.

5.2.4.2. RFIDCredential Feature

If the User Feature is also supported then any RFID credential stored in the lock SHALL be associated with a User.

A lock MAY support multiple credential types so if the User feature is supported the UserType, User-Status and Schedules are all associated with a User index and not directly with a RFID index. A User Index may have several credentials associated with it.

5.2.4.3. FingerCredentials Feature

Currently the cluster only defines the metadata format for notifications when a fingerprint/ finger vein credential is used to access the lock and doesn't describe how to create fingerprint/finger vein credentials. If the Users feature is also supported then the User that a fingerprint/finger vein is associated with can also have its UserType, UserStatus and Schedule modified.

A lock MAY support multiple credential types so if the User feature is supported the UserType, User-Status and Schedules are all associated with a User index and not directly with a Finger index. A User Index may have several credentials associated with it.

5.2.4.4. WeekDayAccessSchedules Feature

If the User feature is supported then Week Day Schedules are applied to a User and not a credential.

Week Day Schedules are used to restrict access to a specified time window on certain days of the week. The schedule is repeated each week.

The lock MAY automatically adjust the UserType when a schedule is created or cleared.

Support for WeekDayAccessSchedules requires that the lock has the capability of keeping track of local time.
