

12.1.6.2. Pausing Cleaning

12.1.6.2.1. Preconditions

Cleaning can only be paused when the RVC Operational State cluster's `OperationalState` attribute is set to a Pause-compatible state. See the Pause Compatibility table and the RVC Pause Compatibility Table.

Note that even if the Pause command is not implemented, the RVC Operational State cluster's `OperationalState` attribute MAY report that the device is in the Paused state due to an out-of-band action, such as the user pressing a physical button on the device.

12.1.6.2.2. Actions

To attempt pausing a cleaning operation, the RVC Operational State cluster can be sent a Pause command.

12.1.6.3. Resuming Cleaning

12.1.6.3.1. Preconditions

Cleaning can only be resumed if the RVC Operational State cluster's `OperationalState` attribute is set to a Resume-compatible state (see Resume Compatibility table and the RVC Resume Compatibility table), and the RVC Run Mode cluster's `CurrentMode` is set to a mode with the Cleaning mode tag.

Note that even if the Resume command is not implemented, the RVC Operational State cluster's `OperationalState` attribute MAY indicate that the device transitioned from the Paused state to the Running state due to an out-of-band action, such as the user pressing a physical button on the device.

12.1.6.3.2. Actions

To attempt resuming a cleaning operation, the RVC Operational State cluster can be sent a Resume command.

12.1.6.4. Stopping Cleaning

12.1.6.4.1. Preconditions

Stopping cleaning can only happen if the RVC Run Mode cluster's `CurrentMode` attribute is set to a mode that has the Cleaning mode tag associated with it.

12.1.6.4.2. Actions

To attempt stopping a cleaning operation, the RVC Run Mode cluster can be sent a `ChangeToMode` command with the `NewMode` field set to a mode that has the Idle mode tag associated with it.

12.1.6.4.3. Side Effects

Note that the device MAY seek the charger after successfully switching the RVC Run Mode cluster to an Idle mode. The `OperationalState` attribute indicates whether the device is seeking the charger, stopped, charging, docked etc.
