13.3. Room Air Conditioner Device Type

This defines conformance to the Room Air Conditioner device type.

A Room Air Conditioner is a device with the primary function of controlling the air temperature in a single room.

13.3.1. Room Air Conditioner Architecture

A Room Air Conditioner is a device which at a minimum is capable of being turned on and off and of controlling the temperature in the living space.

A Room Air Conditioner MAY also support additional capabilities via endpoint composition. See [Section 13.3.5, “Device Type Requirements”](#) for typical device types.

The following diagram shows an example Room Air Conditioner consisting of a parent endpoint that is the Room Air Conditioner device type and several child endpoints providing additional capabilities. Note that two of the child endpoints are of the same device type, Temperature Sensor, which are being disambiguated via the requirements of endpoint composition defined in the system model.
