

Chapter 1. Introduction

This document contains namespaces as part of the semantic tag feature.

The standard namespaces are defined in this appendix. They consist of the common namespaces and device-specific namespaces.

The Common namespaces start with Namespace ID 0x01 and contains semantic tags that can apply to any domain. Examples include direction words like 'left', 'right', 'up' and 'down' or location words like 'inside' and 'outside'.

Device-specific namespaces begin with Namespace ID 0x41. The semantic tags defined in the device-specific namespaces SHALL be restricted for use within each device type or set of device types.

NOTE

Some namespaces specific to certain group of device types (related to Energy and Laundry) have been assigned an ID from the common range, even though they are only applicable to a certain set of device types only.

When indicating a specific namespace and tag in the spec, one of the following two methods SHALL be used:

Method	Example	Note
Double colon separator	Namespace::Tag	Preferred method
Backticks with period separator	`Namespace.Tag`	Also acceptable

NOTE

Previously, the notation with a period separator (example: Namespace.Tag) was also used. Instances using that notation will be updated.

A [TagList](#) MAY combine several of these tags, as appropriate for the device, provided that for any given device type the tags come from the namespace for that device type as well as any of the common namespaces, and/or from a manufacturer-specific namespace.

Tags MAY appear in bold or have any other decoration as needed to achieve the desired effect in the rendered output, such as shown in the example below. The decoration of tags is entirely optional.

Example: An outdoor luminaire with two light units, one shining upwards and one shining downwards. One light unit would be represented by an endpoint with a TagList which has TagStructs with Tags **Location::Outdoor** and **Position::Top** and **Direction::Upward**, while the other light unit would be represented by an endpoint with a TagList which has TagStructs with Tags **Location::Outdoor** and **Position::Bottom** and **Direction::Downward**.

ID	Namespace	Summary
Common namespaces
